Use %LOCALAPPDATA% in the launcher

This keeps your Windows account name out of the launcher while letting Windows find Python in your own profile.

What the variable means

%LOCALAPPDATA% is a Windows shortcut for your account's local application-data folder. Windows expands it when a .bat file runs. For each person, it points to that person's own profile, so the same generic launcher line can work on different PCs.

The exact line to use

OLD FORM - includes a personal Windows profile path

```
set "PYTHON_EXE=C:\Users\YourName\AppData\Local\Programs\Python\Python313\python.exe"
```

NEW FORM - generic path (recommended)

```
set "PYTHON_EXE=%LOCALAPPDATA%\Programs\Python\Python313\python.exe"
```

Where to change it

FILE	WHAT TO DO
Start Archive Shelf.bat	Edit this real launcher. Find the line that starts with `set "PYTHON_EXE=` and replace the full line.
Check ReplayWeb.page Updates.bat	Make the same change so the optional viewer updater can find Python too.
Archive Shelf Source Code.txt	This is a readable reference copy. Keep its matching line updated; editing it alone does not change the launcher.

Edit it in Notepad

1. Open the Archive Shelf folder. Right-click **Start Archive Shelf.bat** and choose **Edit** (or Open with Notepad).

2. Find the line beginning `set "PYTHON_EXE=`. Replace that entire line with the NEW FORM shown above, then save.

3. Repeat in **Check ReplayWeb.page Updates.bat**. The source-code text file is only a reference copy.

If your Python install is different

The example assumes Python 3.13 installed in the usual per-user location. To check, open File Explorer, enter `%LOCALAPPDATA%\Programs\Python` in its address bar, and look for your Python version folder (for example, `Python313`). Open that folder and confirm it contains `python.exe`. If the folder name differs, change `Python313` in the line to match. If Python is installed somewhere else, point the line to that actual executable instead.

Check the change

Double-click **Start Archive Shelf.bat**. The window should say Archive Shelf is running and show its local address. Keep that window open while using the organizer. If Windows reports that Python was not found, recheck the path and version.

For a public release: the `library` folder contains saved archives, and `tmp` can contain server logs. Check or exclude those user-data folders before sharing.
